We have made the test!

Our technicians have simulated the impact of sun, wind and dust by means of a sandjet at a laboratory. The result: the colored through FP indicator signs also withstood that extreme test. Whereas information on aluminium signs that carry plotted lettering did practically not exist anymore. Clearly speaking: colored through FP signs are perfectly suitable for the outdoor usage because important information withstands even extremely bad weather conditions. With this, actions can be taken fast in case of danger. By the way: FP grants a 15 year warranty on indicator signs made of plastic. It includes functionality, break resistance, readability and color stability.

Before the sandblasting test

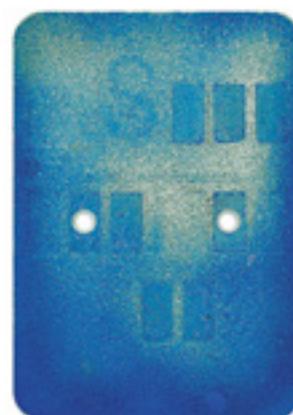

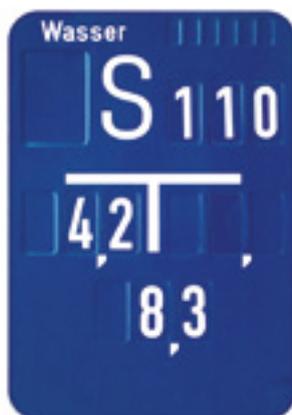

After the sandblasting test

surface only slightly affected, perfectly legible

surface only slightly affected, perfectly legible

information totally disappeared, a safety risk
